Description: Implement the design as closely as possible to the reference design

Key points:

- Using React, you can install dependency packages according to your needs.
- Implement basic layout and styling for the page.
- The page consists of an input bar, a switch, a radio, a group of checkboxes, and a button.

- Only when the switch is on (like in left image), the rest of the components are activated and can be edited.
- The styling for the radio and multi-selection checkboxes should be consistent.
- Initial values can be set using the data object inside the file data.js, with the switch defaulting to the "on" state.
- After clicking the "process" button, print the current state of the data object to the console.

Bonus points:

- follow the 'Input Variant' part to fulfill the input animation.
- Using tailwind css
- Using typescript
- Use Ant Design (antd) to write components. For the multi-select checkboxes, override the default styles of the Ant Design component with custom styles.
